

I'd like to know where Excelaron plans to buy a 35 kilowatt generator that only uses 23 gallons of propane a day.

That figure for fuel consumption should be more like 183 gallons a day. That's a difference of 58,000 gallons of propane a year. Which sounds like more emissions and more propane truck traffic.

This is just another of too many examples of Excelaron's project description not being accurate, complete, or honest.
